DECISION SUPPORT | ILLUSTRATIVE REPORTING MODEL

Operational Reporting Sample

A lightweight Excel pivot design for monitoring workload, risk and execution discipline.

SOURCE DATA SHAPE

One row per case or action. Keep the raw log separate from pivot views; standardise field values before summarising.

Case ID	Date Opened	Channel	Stage	Owner	Due Date	Status	Blocker	Date Closed
Unique	Date	List	List	Person	Date	Controlled list	Controlled list	Date / blank

PIVOT VIEW	ROWS / COLUMNS	VALUES / FILTER	WHAT LEADERSHIP SEES
Open workload	Stage × Owner	Count of Case ID; filter Status = Open	Where work sits and whether ownership is balanced.
Aging / overdue	Owner × Age band	Count of open items past due; buckets 0–2, 3–7, 8+ days	Which exceptions need intervention first.
Weekly throughput	Week × Status	Cases opened vs. closed; close date by week	Whether completion is keeping pace with incoming work.
Blocker pattern	Blocker × Stage	Count of open cases; filter by reporting period	Recurring dependencies or handoff points to investigate.
Closure time	Stage / Channel	Median days from opened to closed; closed items only	Where cycle time may need a deeper process review.

OPEN ITEMS	OVERDUE	CLOSED THIS WEEK	MEDIAN CYCLE TIME
Live count	**Live count**	**Weekly count**	**Median days**
Filter: Status = Open	Status ≠ Closed and Due Date < Today	Date Closed within reporting week	Date Closed – Date Opened

Quality controls: unique case IDs; controlled status values; valid dates; one reporting cutoff; documented refresh date; reconciliation of totals against the source log. No sample results are invented here.
